[00:00:00] This is a quick tutorial, and I will show you how to write code and save files and Sublime Text. This is a very popular text editor used for developing webpages. The first step is we're going to go over to our file manager and we are going to open or create a new folder.

[00:00:30] We're just going to call this folder "Test." Then using our launchpad, we're just going to go over and open up Sublime Text. The next step is to reopen that file manager.

[00:01:00] We're going to just click and drag over our folder. This is really helpful for productivity. This allows you to have multiple files in a folder, you can just select that particular file without going back into your file manager. It does make it a lot easier.

The first step is we're going to go to the file Save File As and we're just going to call this file *index.html*. And we're just going to make sure we select the test folder and see we have that file now there.

[00:02:00] If we were to create a newer file, we could actually go and select between those files to open. So the next step is we need to start coding.

So what you want to do is you just want to type in HTML, hit tab, and it populates all the tags needed for your webpage.

[00:02:30] The head, um, is basically everything you see, when you open up a web browser everything that you see in that tab that's known as the head. And then the body is what you actually see on the web page. We're going to just title this page test. When we save this folder and we open up, open it up in a web browser.

[00:03:00] We'll actually see the name test written on, the tab. Into the body we're just going to start with, H1. You're going to select tab. I'm just going to say "Hello world!"

[00:03:30] H1 would be our top header. And then, our P tag is for body text or paragraph. That's what it stands for. You're just going to select P. And hit tab and we're just going to do placeholder text and so forth with placeholder text.

[00:04:00] All you have to do is just type in L-O-R-E-M tab and that is your placeholder text. Now we're going to go to file and select. Save All. You can do Save or Save all, but I prefer to do Save All, especially if I have multiple files open.

[00:04:30] Then we're going to actually go to the web browser to open up our page. What you want to do is you want to go back to your file manager and select *index.html*. When you select it, here we see our page.

[00:05:00] We have our Test, and our title in the tab, and then, everything that was under the body is on our webpage.

That is it. If you have any questions, please let me know.
